Chapter 1

Main Page

Implementation of markov chains for random text generation.

1.1 Description

Markovman is a program for random text generation based on markov chains. The generator is trained from a corpus. The only supported format for the corpus is as a text file, with dots '.' separating sentences.

1.2 Usage

The following is the interface as I plan to implement it, although it hasn't been written yet. The easiest way to use Markovman is to call it together with a corpus-file.

```
markovman path/to/corpus.txt
```

That will put the program in a loop, reading from stdin. You can pass the following commands:

```
gen N
```

will generate N sentences one after the other based on the corpus.

```
kill X
```

will make the word X disappear from the corpus.

```
exit
```

will exit the program

Another possibility is running the program like the following, which will generate N sentences and close immediately.

```
markovman path/to/corpus.txt -n N
```

Chapter 2

File Index

2.1 File List

Here is a list of all documented files with brief descriptions:

src/ markovman.c	
The main file, where the interface is implemented	8
src/include/ minunit.h	
A very minimal unit test library	5
src/include/ statemach.h	
Header file for state machines	7
src/lib/ statemach.c	
File implementing state machines	7

Chapter 3

File Documentation

3.1 src/include/minunit.h File Reference

A very minimal unit test library.

Macros

- #define `mu_assert`(message, test) do { if (!(test)) return message; } while (0)
Macro to assert equality in a unit test.
- #define `mu_run_test`(test)
Macro to run a test.

Variables

- int `tests_run` = 0
Global set to the amount of tests that ran.

3.1.1 Detailed Description

A very minimal unit test library.

3.1.2 Macro Definition Documentation

3.1.2.1 mu_assert

```
#define mu_assert(  
    message,  
    test ) do { if (!(test)) return message; } while (0)
```

Macro to assert equality in a unit test.

This macro checks whether 'test' is a true value. If it is, then the macro does nothing. Otherwise, it will pass a message as the return value of the function in which the macro will be expanded.

Parameters

<i>message</i>	This message will be the return value of whichever function implements mu_assert. It should be a message to be sent if the assertion fails.
<i>test</i>	This is the value being asserted. It should evaluate to a true value in successful tests.

3.1.2.2 mu_run_test

```
#define mu_run_test(  
    test )
```

Value:

```
do { char *message = test(); tests_run++; \
    if (message) return message; } while (0)
```

Macro to run a test.

This macro is used to run a 'test' function, which should return 0 if everything is alright. This macro should be included in functions with a *char return type.

Parameters

<i>test</i>	A pointer to a function that returns 0 if everything is alright and a message (*char) if there's an error.
-------------	--

3.1.3 Variable Documentation

3.1.3.1 tests_run

```
int tests_run = 0
```

Global set to the amount of tests that ran.

This variable gets increased when `mu_run_test` runs, and it should hold the amount of tests ran at the end of the test program.

3.2 src/include/statemach.h File Reference

Header file for state machines.

3.2.1 Detailed Description

Header file for state machines.

Author

Ian G. Tayler

Date

5 May 2017 (creation)

This exports the names from [lib/statemach.c](#) that we will need in `src/main.c`.

3.3 src/lib/statemach.c File Reference

File implementing state machines.

3.3.1 Detailed Description

File implementing state machines.

Author

Ian G. Tayler

Date

5 May 2017 (creation)

This is the file where all the action happens. We define the struct 'Word' and a few functions for handling it. That covers most of the program's logic.

<https://github.com/IanTayler/markovman.git>

3.4 src/markovman.c File Reference

The main file, where the interface is implemented.

```
#include <stdio.h>
#include "statemach.h"
```

Functions

- int **main** (void)

3.4.1 Detailed Description

The main file, where the interface is implemented.
