# Chapter 1

## Main Page

Implementation of markov chains for random text generation.

### 1.1 Description

Markovman is a program for random text generation based on markov chains. The generator is trained from a corpus. The only supported format for the corpus is as a text file, with dots '.' separating sentences.

### 1.2 Usage

The following is the interface as I plan to implement it, although it hasn't been written yet. The easiest way to use Markovman is to call it together with a corpus-file.

```
markovman path/to/corpus.txt
```

That will put the program in a loop, reading from stdin. You can pass the following commands:

```
gen N
```

will generate N sentences one after the other based on the corpus.

```
kill X
```

will make the word X disappear from the corpus.

```
exit
```

will exit the program

Another possibility is running the program like the following, which will generate N sentences and close immediately.

```
markovman path/to/corpus.txt -n N
```

## Chapter 4

# Data Structure Documentation

### 4.1 Markov Struct Reference

Struct that holds all the information relevant to a markov chain.

```
#include <statemach.h>
```

#### 4.1.1 Detailed Description

Struct that holds all the information relevant to a markov chain.

The struct consists of:

- **lengthip**: the number of words used at the beginning of a sentence.
- **sizeip**: size of the buffer for **initpos**.
- **lengthwl**: number of words in total.
- **sizewl**: size of the buffer for words.
- **initpos**: an array with all positions of the wordlist that hold initial words.
- **wordlist**: a list with all the words.

The documentation for this struct was generated from the following file:

- `src/include/statemach.h`

### 4.2 ThisMarkov Struct Reference

#### Data Fields

- **int** **lengthip**
- **int** **sizeip**
- **int** **lengthwl**
- **int** **sizewl**
- **int \*** **initpos**
- [Word](#) **\*\* wordlist**

The documentation for this struct was generated from the following file:

- `src/include/statemach.h`

### 4.3 ThisWord Struct Reference

#### Data Fields

- int **isendsymb**
- char \* **token**
- int \* **freqlist**

The documentation for this struct was generated from the following file:

- [src/include/statemach.h](#)

### 4.4 Word Struct Reference

Struct for representing states in a first order [Markov](#) chain.

```
#include <statemach.h>
```

#### 4.4.1 Detailed Description

Struct for representing states in a first order [Markov](#) chain.

The struct consists of:

- **isendsymb**: pseudo-boolean. True for punctuation symbols.
- **token**: a pointer to the string representation of the word.
- **freqlist**: a pointer to an array of integers. Marks the frequency of each item in a corresponding wordlist.

The documentation for this struct was generated from the following file:

- [src/include/statemach.h](#)

## Chapter 5

# File Documentation

### 5.1 `src/include/lexer.h` File Reference

Definitions to handle a lexer.

#### Functions

- `char * get_next_token (FILE *filedesc, char *endsymb)`

#### 5.1.1 Detailed Description

Definitions to handle a lexer.

#### Author

Ian G. Tayler

#### Date

14 May 2017 (creation)

Here we define a lexer for natural language strings. It works by recognising ' ', ',', '.', ':', ';', '!', '?', etc. as special characters that mark the end of a token. Special characters are then added to the token list as another stand-alone token.

#### Note

This file has the documentation for all exported functions and structs. For the documentation for internal-only aspects of the program, see [lexer.c](#)

#### See also

<https://github.com/IanTayler/markovman.git>

## 5.2 src/include/minunit.h File Reference

A very minimal unit test library.

### Macros

- `#define mu_assert(message, test) do { if (!(test)) return message; } while (0)`  
*Macro to assert equality in a unit test.*
- `#define mu_run_test(test)`  
*Macro to run a test.*
- `#define mu_assert_freeing(message, test, pointer) do { if (!(test)) { free(pointer); return message; } } while (0)`  
*Macro to assert equality in a unit test, freeing a pointer.*
- `#define mu_assert_running(message, test, block) do { if (!(test)) { block; return message; } } while (0)`  
*Macro to assert equality in a unit test, running a block if the test fails.*

### Variables

- `int tests_run`  
*Global set to the amount of tests that ran.*

### 5.2.1 Detailed Description

A very minimal unit test library.

#### Author

Jera Design

#### Date

Unknown

#### See also

<http://www.jera.com/techinfo/jtns/jtn002.html>

### 5.2.2 Macro Definition Documentation

#### 5.2.2.1 mu\_assert

```
#define mu_assert(  
    message,  
    test ) do { if (!(test)) return message; } while (0)
```

Macro to assert equality in a unit test.

This macro checks whether 'test' is a true value. If it is, then the macro does nothing. Otherwise, it will pass a message as the return value of the function in which the macro will be expanded.

## Parameters

<i>message</i>	This message will be the return value of whichever function implements <code>mu_assert</code> . It should be a message to be sent if the assertion fails.
<i>test</i>	This is the value being asserted. It should evaluate to a true value in successful tests.

## Note

MinUnit macro.

5.2.2.2 `mu_assert_freeing`

```
#define mu_assert_freeing(  
    message,  
    test,  
    pointer ) do { if (!(test)) { free(pointer); return message; } } while (0)
```

Macro to assert equality in a unit test, freeing a pointer.

This macro behaves very similarly to [mu\\_assert\(\)](#), the main difference being that this macro frees a pointer passed as the first argument of the macro before returning.

## Parameters

<i>message</i>	This message will be the return value of whichever function implements <code>mu_assert</code> . It should be a message to be sent if the assertion fails.
<i>test</i>	This is the value being asserted. It should evaluate to a true value in successful tests.
<i>pointer</i>	This pointer will be freed before returning if the test fails.

## Note

This macro was defined by Ian Tayler in 2017 and doesn't belong to MinUnit

5.2.2.3 `mu_assert_running`

```
#define mu_assert_running(  
    message,  
    test,  
    block ) do { if (!(test)) { block; return message; } } while (0)
```

Macro to assert equality in a unit test, running a block if the test fails.

Like [mu\\_assert\\_freeing\(\)](#), but running a full block of code instead of just freeing a pointer before returning.

## Note

This macro was defined by Ian Tayler in 2017 and doesn't belong to MinUnit

#### 5.2.2.4 mu\_run\_test

```
#define mu_run_test(  
    test )
```

##### Value:

```
do { char *message = test(); tests_run++; \  
    if (message) return message; } while (0)
```

Macro to run a test.

This macro is used to run a 'test' function, which should return 0 if everything is alright. This macro should be included in functions with a \*char return type.

##### Parameters

<i>test</i>	A pointer to a function that returns 0 if everything is alright and a message (*char) if there's an error.
-------------	--

##### Note

MinUnit macro.

### 5.2.3 Variable Documentation

#### 5.2.3.1 tests\_run

```
int tests_run
```

Global set to the amount of tests that ran.

This variable gets increased when mu\_run\_test runs, and it should hold the amount of tests ran at the end of the test program.

##### See also

[mu\\_run\\_test](#)

## 5.3 src/include/statemach.h File Reference

Header for state machines.

### Data Structures

- struct [ThisWord](#)
- struct [ThisMarkov](#)

## Typedefs

- typedef struct [ThisWord](#) **Word**
- typedef struct [ThisMarkov](#) **Markov**

## Functions

- [Markov](#) \* [induce\\_markov](#) (FILE \*filedesc)  
*Get a markov chain from a file.*
- void [free\\_Markov](#) ([Markov](#) \*m)  
*Free all dynamically allocated resources used in the passed [Markov](#) struct.*
- char \* [generate\\_sentence](#) ([Markov](#) \*m)  
*Generate a sentence from a [Markov](#) chain.*

### 5.3.1 Detailed Description

Header for state machines.

#### Author

Ian G. Tayler

#### Date

13 May 2017 (creation)

This is the file where all the important definitions are. We define the struct '[Word](#)' and a few functions for handling it. We also define the '[Markov](#)' struct. That covers most of the program's logic.

#### Note

This file has the documentation for all exported functions and structs. For the documentation for internal-only aspects of the program, see [lexer.h](#)

#### See also

<https://github.com/IanTayler/markovman.git>

### 5.3.2 Function Documentation

#### 5.3.2.1 [free\\_Markov\(\)](#)

```
void free_Markov (  
    Markov * m )
```

Free all dynamically allocated resources used in the passed [Markov](#) struct.

**Parameters**

<i>m</i>	A pointer to a <a href="#">Markov</a> .
----------	---

**5.3.2.2 generate\_sentence()**

```
char* generate_sentence (
    Markov * m )
```

Generate a sentence from a [Markov](#) chain.

**Parameters**

<i>m</i>	A pointer to a <a href="#">Markov</a> .
----------	---

**Returns**

A pointer to a dynamically allocated string.

**5.3.2.3 induce\_markov()**

```
Markov* induce_markov (
    FILE * filedesc )
```

Get a markov chain from a file.

It will return a pointer to a dynamically allocated [Markov](#) struct. You should later free it with [free\\_Markov\(\)](#).

Do not use `free()` as it won't free dynamically allocated members of the [Markov](#) struct.

**Parameters**

<i>filedesc</i>	A FILE.
-----------------	---------

**Returns**

A pointer to a [Markov](#) induced from `filedesc`.

**5.4 src/lib/lexer.c File Reference**

Implementation of a lexer.

```
#include <stdio.h>
#include <stdlib.h>
#include "lexer.h"
```

## Macros

- `#define BASEBUFSIZE 8` /\* Preferably set it to a power of 2. \*/

## Functions

- `int append_char` (char \*\*token, char appc, int pos, int size)  
*Append a char to a token, growing it if necessary. Return the final size of the token in allocated bytes (not the string length).*
- `char * get_next_token` (FILE \*filedesc, char \*endsymb)

### 5.4.1 Detailed Description

Implementation of a lexer.

#### Author

Ian G. Tayler

#### Date

14 May 2017 (creation)

Here we implement a lexer for natural language strings. It works by recognising ' ', ',', '!', '?', etc. as special characters that mark the end of a token. Special characters are then added to the token list as another stand-alone token.

#### Note

This file has the documentation for all *internal* (i.e. unexported) functions and structs. For the documentation of the API, see [lexer.h](#)

#### See also

<https://github.com/IanTayler/markovman.git>

### 5.4.2 Macro Definition Documentation

#### 5.4.2.1 BASEBUFSIZE

```
#define BASEBUFSIZE 8 /* Preferably set it to a power of 2. */
```

This is the the minimum size we'll allocate for our tokens. Smaller values mean the program will use less memory, but it will be slower when it has to allocate larger strings.

### 5.4.3 Function Documentation

#### 5.4.3.1 `append_char()`

```
int append_char (
    char ** token,
    char appc,
    int pos,
    int size )
```

Append a char to a token, growing it if necessary. Return the final size of the token in allocated bytes (*not* the string length).

##### Parameters

<i>token</i>	A pointer to the pointer to the token to which to append a character.
<i>appc</i>	The character to be appended.
<i>pos</i>	The position where the character goes.
<i>size</i>	The initial size of the memory buffer for the token.

##### Returns

The final size of the memory buffer for the token.

##### Note

If the character doesn't fit, the buffer will be grown to the double of its current size.

## 5.5 `src/lib/statemach.c` File Reference

Implementation of state machines.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "lexer.h"
#include "statemach.h"
```

### Macros

- `#define INITWORD -1`  
A constant that's used to mark that there is no 'previous' word.
- `#define BASELEXSIZE 512`  
A constant that defines how initial allocation of words will be.
- `#define BASEINITWORDS 32`  
A constant that defines how many int-s we will allocate initially for our list of initial words.
- `#define BASESENTENCESIZE 256`

## Functions

- `int finalsymb (char symb)`  
*Return 1 if symb is a final symbol. 0 if not.*
- `int append_int (int **arr, int appi, int pos, int size)`  
*Append an int to a dynamically allocated int array, growing it if necessary. Return the final size of the token in allocated bytes (not the length of actually used ints).*
- `int append_Word (Word ***arr, Word *appw, int pos, int size)`  
*Append an int to a dynamically allocated int array, growing it if necessary. Return the final size of the token in allocated bytes (not the length of actually used ints).*
- `int findstr (Word **wordarr, int wordarr_len, char *str)`  
*Find the location of a string in an array of words. If the string isn't in the array, return -1.*
- `int findsymb (char *symbarr, int symbarr_len, char symb)`  
*Find the location of a char in a char array. If it isn't there, return -1.*
- `Word * new_Word (char *tok)`  
*Get a word without a freqlist allocated from a string.*
- `Word * new_endsymb (char symb)`  
*allocate a Word corresponding to a certain punctuation symbol.*
- `void free_Word (Word *w)`  
*Safely deallocate a Word.*
- `Markov * induce_markov (FILE *filedesc)`  
*Get a markov chain from a file.*
- `void free_Markov (Markov *m)`  
*Free all dynamically allocated resources used in the passed Markov struct.*
- `int randto (int r)`  
*Function to get random int <= r.*
- `int write_string (char **s, char *apps, int *pos, int size)`
- `int sumfreqs (Markov *m, int wordpos)`
- `char * generate_sentence (Markov *m)`  
*Generate a sentence from a Markov chain.*

### 5.5.1 Detailed Description

Implementation of state machines.

#### Author

Ian G. Tayler

#### Date

13 May 2017 (creation)

This is the file where all the important definitions are. We define the struct 'Word' and a few functions for handling it. We also define the 'Markov' struct. That covers most of the program's logic.

#### Note

This file has the documentation for all *internal* (i.e. unexported) functions and structs. For the documentation of the API, see [statemach.h](#)

## 5.5.2 Macro Definition Documentation

### 5.5.2.1 BASEINITWORDS

```
#define BASEINITWORDS 32
```

A constant that defines how many int-s we will allocate initially for our list of initial words.

A constant that defines how many int-s we will allocate initially for our list of position in the wordlist array that hold pointers to words that have appeared at the beginning of a sentence.

It should normally be set to a power of 2 to optimize malloc and realloc in certain implementations.

### 5.5.2.2 BASELEXSIZE

```
#define BASELEXSIZE 512
```

A constant that defines how initial allocation of words will be.

It should normally be set to a power of 2 to optimize malloc and realloc in certain implementations.

### 5.5.2.3 INITWORD

```
#define INITWORD -1
```

A constant that's used to mark that there is no 'previous' word.

When we're inducing a markov chain, we need to save in a variable an int that marks where in the wordlist we can find a pointer to the previous word. When we're on the first word, we save INITWORD in that variable instead, which is defined to be different from all natural numbers.

## 5.5.3 Function Documentation

### 5.5.3.1 append\_int()

```
int append_int (
    int ** arr,
    int appi,
    int pos,
    int size )
```

Append an int to a dynamically allocated int array, growing it if necessary. Return the final size of the token in allocated bytes (*not* the length of actually used ints).

**Parameters**

<i>arr</i>	A pointer to the pointer to the array to which to append an int.
<i>appi</i>	The int to be appended.
<i>pos</i>	The position where the int goes.
<i>size</i>	The initial size of the memory buffer for the array.

**Returns**

The final size of the memory buffer for the int.

**Note**

If the int doesn't fit, the buffer will be grown to the double of its current size.

**5.5.3.2 append\_Word()**

```
int append_Word (
    Word *** arr,
    Word * appw,
    int pos,
    int size )
```

Append an int to a dynamically allocated int array, growing it if necessary. Return the final size of the token in allocated bytes (*not* the length of actually used ints).

**Parameters**

<i>arr</i>	A pointer to the pointer to the array to which to append a pointer.
<i>appw</i>	The pointer to be appended.
<i>pos</i>	The position where the pointer goes.
<i>size</i>	The initial size of the memory buffer for the array.

**Returns**

The final size of the memory buffer for the pointer.

**Note**

If the pointer doesn't fit, the buffer will be grown to the double of its current size.

**5.5.3.3 finalsymb()**

```
int finalsymb (
    char symb )
```

Return 1 if symb is a final symbol. 0 if not.

**Parameters**

<i>symb</i>	The symbol to check.
-------------	----------------------

**Returns**

True (1) or False (0), depending whether or not the argument is a final symbol.

**5.5.3.4 findstr()**

```
int findstr (
    Word ** wordarr,
    int wordarr_len,
    char * str )
```

Find the location of a string in an array of words. If the string isn't in the array, return -1.

**Parameters**

<i>wordarr</i>	An array of words.
<i>wordarr_len</i>	The length of the array of words.
<i>str</i>	The string to find.

**Returns**

Either the first place of the string in the array or -1 if it isn't there.

**5.5.3.5 findsymb()**

```
int findsymb (
    char * symbarr,
    int symbarr_len,
    char symb )
```

Find the location of a char in a char array. If it isn't there, return -1.

**Parameters**

<i>symbarr</i>	An array of chars.
<i>symbarr_len</i>	The length of the array of chars.
<i>symb</i>	The char to find.

**Returns**

Either the first location of the char in the array, or -1 if it isn't there.

**5.5.3.6 free\_Markov()**

```
void free_Markov (
    Markov * m )
```

Free all dynamically allocated resources used in the passed [Markov](#) struct.

**Parameters**

<i>m</i>	A pointer to a <a href="#">Markov</a> .
----------	---

**5.5.3.7 free\_Word()**

```
void free_Word (
    Word * ptr )
```

Safely deallocate a [Word](#).

**Parameters**

<i>ptr</i>	The pointer to deallocate.
------------	----------------------------

**5.5.3.8 generate\_sentence()**

```
char * generate_sentence (
    Markov * m )
```

Generate a sentence from a [Markov](#) chain.

**Parameters**

<i>m</i>	A pointer to a <a href="#">Markov</a> .
----------	---

**Returns**

A pointer to a dynamically allocated string.

#### 5.5.3.9 induce\_markov()

```
Markov * induce_markov (
    FILE * filedesc )
```

Get a markov chain from a file.

It will return a pointer to a dynamically allocated [Markov](#) struct. You should later free it with [free\\_Markov\(\)](#).

Do not use `free()` as it won't free dynamically allocated members of the [Markov](#) struct.

##### Parameters

<i>filedesc</i>	A FILE.
-----------------	---------

##### Returns

A pointer to a [Markov](#) induced from *filedesc*.

#### 5.5.3.10 new\_endsymb()

```
Word * new_endsymb (
    char symb )
```

allocate a [Word](#) corresponding to a certain punctuation symbol.

##### Parameters

<i>symb</i>	The punctuation char.
-------------	-----------------------

##### Returns

A pointer to a dynamically allocated [Word](#).

#### 5.5.3.11 new\_Word()

```
Word * new_Word (
    char * tok )
```

Get a word without a freqlist allocated from a string.

##### Parameters

<i>tok</i>	The string.
------------	-------------

#### Returns

A pointer to a dynamically allocated [Word](#).

#### 5.5.3.12 randto()

```
int randto (  
    int r )
```

Function to get random int  $\leq r$ .

#### Parameters

<i>r</i>	Maximum number
----------	----------------

#### Returns

a random int between 0 and r.

#### Note

This should give a slightly better distributed result than `rand() % r`.

## 5.6 src/markovman.c File Reference

The main file, where the interface is implemented.

```
#include <stdio.h>  
#include <stdlib.h>  
#include <time.h>  
#include "statemach.h"
```

#### Macros

- `#define VERSION "0.5.0"`  
*String constant holding the current version of Markovman.*

#### Functions

- `int main (int argc, char **argv)`

### 5.6.1 Detailed Description

The main file, where the interface is implemented.

#### Author

Ian G. Tayler
